

TREATING FELINE SNUFFLES, NATURALLY!

The use of Eco-Snuff from a Veterinary point of view:

Why use it?

The major causes of **Feline Snuffles** (especially the respiratory 'cat flu' variety) are viruses. In terms of recovery from viruses most treatments rely on supportive measures thus allowing the bodies' own immune system to overcome the virus.

Homeopathic medicines, like Eco-Snuff are essentially nanomedicines and act at the cellular level.

They are specifically designed to strengthen the immune system, allowing the body to cure itself. This means that the use of Eco-Snuff, which contains ingredients especially designed to strengthen the immune system at the level of the lungs and mucous membranes, is an important part of the successful treatment of snuffles.

When should it be used?

Essentially – as soon as possible in any treatment protocol.

The early use of Eco-snuff will result in better support of the immune system allowing a faster recovery.

Information compiled by Dr Jan Moll BVSc, PGDPM, Cert.M (DMS)

Dr Moll used Eco-Snuff extensively in his time at the SPCA Roodepoort, thus speaking from experience when he compiled this report for Eco-Vet.

What results can be expected?

This does depend on the severity of the disease when presented. At times, the disease is so far progressed that there is already organ damage – especially the kidneys if the cat is severely dehydrated. In this case, no matter what is used the prognosis is not good. If the patient is not so severe Eco-Snuff is an important PART of the treatment protocol, and – even in severe disease, the results are usually that the cat recovers quicker than if not used – and there is a higher recovery success. In the mild disease – especially with cats with recurrent snuffles, there is often no need for any fluids or antimicrobial therapy, and as the mucous membranes are stabilized quicker, the cat will not go off its food or water and will recover with conservative therapies.

How soon can results be seen:

As always, that would depend on the severity of the condition. In severe snuffles that is an ‘emergency’ case the results can be mixed as the disease could have progressed too far (dehydration/ shock) for the treatment protocol to work. What can be seen is, if that can be overcome, is a response that is relatively rapid – noting that the Eco-Snuff needs to be a PART of the treatment protocol. The response at the cellular membrane level is actually quite rapid, and when Eco-Snuff has been used as a part of the protocol, treatment duration is shortened, and treatment success is increased. In the milder cases, and especially in those cats that show a recurring condition the use of Eco-Snuff, either on its own or with one of the other support measures (Feline/ Interferon) is usually successful.

How to use it & until when:

(Please refer to pack insert for full information)

The product is administered orally:

Draw up 0.5ml in a syringe, mix with water to 1ml and administer 3 times daily

OR *Mix 2ml in 10ml water and administer 2ml of this mixture 3 times daily*

This should be used for at least 2 weeks or can be administered longer should the symptoms not be fully resolved.

All Eco-Vet remedies are registered with the Department of Agriculture under Act 36 of 1947.
